

SLIDE RACKS

PowerTech's line of generator slide racks are built for durability, precision, and ease of maintenance. Each rack is engineered from powder-coated steel and designed to fit specific PowerTech Generator models. All slide racks incorporate high-strength cam rollers with sealed bearings for long-term reliability, and each unit securely locks into place. Both the front slide and side slide racks extend approximately half the length of the rack base, providing stable access for maintenance. Choosing between a front or side slide rack depends on your generator's installation and the space available in the designated compartment. While both deliver dependable performance, the side slide rack offers easier maintenance access due to the generator's orientation, making it a preferred choice in tighter applications.
